

## Experiment 2: two machines on one Docker network

```
docker build -t two-machines-lab .  
docker network create elixir-demo
```

### Client container

```
docker run --rm -it --name client \  
  --hostname client --network elixir-demo \  
  two-machines-lab /bin/bash
```

### Server container

```
docker run --rm -it --name server \  
  --hostname server --network elixir-demo \  
  two-machines-lab /bin/bash
```

**Lesson:** Docker gives two isolated machines a shared private network and DNS.
