

The wire explains the magic

```
tcpdump -n -i any -l 'port 4369 or portrange 9100-9101'
```

server:54480 → client:4369

EPMD: "Where is cthulu?"

server:42250 → client:9100

The durable distributed-Elixir connection

The source port is random. The destination port is the important part: EPMD first, then the node's pinned distribution port.
